

**CMSI 387-01**  
**OPERATING SYSTEMS**  
Spring 2013

**Assignment 0423 Feedback**

**Kaitlyn Higa**

*1b* — You have successfully added to your knowledge of how operating systems manage memory. (+)

*2d* — You correctly implemented paged address translation. (+)

*4a* — Your code is functionally correct. (+)

*4b* — You generally maintained the separation of concerns provided by the given code, with the exception of the missed opportunity to use the `#defined` macros. Your code remains correct but just a little harder to adapt to other memory configurations. (|)

*4c* — Your code is quite readable overall. You have a minor spacing issue with your `if` statements, but not enough to drag down this proficiency. (+)

*4d* — Your successful implementation shows good use of available resources. (+)

*4e* — A single commit, although with a descriptive message, is not the best version control activity, but also sort of understandable given the relatively simple task. Still, you could have been a little bit more meticulous, just to maintain the habit. (|)

*4f* — Submitted on time. (+)
